GaSb – the next big technology for digital health: some insight into *Brolis* sensor activity

2019-07-02 16:00 / NFTMC D401, Saulėtekio 3

I will present a short review of the photonic sensor technology development at Brolis over the last 5-6 years. Main focus will be on our work around GaSb swept-wavelength laser technology as a key component for a revolutionary sensor concept. I hope to provide some early insight how this technology is on the verge to become the next big semiconductor platform in the world.
